

classy - The Python wrapper

Thomas Tram

Institute of Gravitation and Cosmology

October 27, 2014

Compiled languages

- The code must be **compiled** before it can be executed.
- It will often be **faster**...
- but **less flexible** since some decisions can not be made at runtime.
- C, C++, Fortran, ...

Interpreted languages

- The code is **interpreted** during execution.
- It can be **slower** but is **very flexible**.
- MATLAB, Octave, IDL, Python, ...

Cython

- **Cython** is a **compiled** language.
- It understands most **Python** syntax.
- It can directly call **external** C libraries, such as `libclass.a`.
- It produces a **Python** module.

classy, the CLASS wrapper

- Written in **Cython**.
- Automatically compiled and installed when you type `make`.
- Needed for MONTE PYTHON and when using CLASS from **Python**.

classy, the CLASS wrapper

- All the functionality of **classy** is found in the **Python class called Class**.
- In **Python** import **Class** by: `from classy import Class`

Running CLASS from Python

```
from classy import Class
import numpy as np
import matplotlib.pyplot as plt

cosmo = Class()
cosmo.set({'output': 'tCl, pCl, lCl', 'lensing': 'yes', '
        modes': 's, t', 'r': '0.2'})
cosmo.compute()
cosmo.cleanup()
```

Solving exercise 1b in Python

```
from classy import Class
import numpy as np
import matplotlib.pyplot as plt

cosmo = Class()
cosmo.set({'output': 'tCl,pCl,lCl', 'lensing': 'yes', '
        modes': 's,t', 'r': '0.2'})
cosmo.compute()
cosmo.cleanup()

l = np.array(range(2,2501))
factor = l*(l+1)/(2*np.pi)
raw_cl = cosmo.raw_cl(2500)
lensed_cl = cosmo.lensed_cl(2500)
raw_cl.viewkeys()
```

Exercise 1b in Python 2/2

Solving exercise 1b in Python

```
plt.loglog(1, factor*raw_c1['bb'][2:], 1, factor*
           lensed_c1['bb'][2:])
plt.xlabel(r"$\ell$")
plt.ylabel(r"$\ell(\ell+1)/(2\pi) C_l^{BB}$")
plt.tight_layout()
plt.savefig("solution1b.pdf")
```

IPython Notebook

IPython Notebook is a Mathematica style (cell) interface to IPython.

- Has Tab-completion of variables and function names.
- Nicely presents the documentation of each function.
- Easy way to get started on Python.

Launching IPython Notebook

Write the following command to launch the notebook:

```
ipython notebook --pylab=inline  
    --InlineBackend.figure_format=svg
```

You probably want to alias this command to e.g. `inote`.

You can open an existing notebook by

```
inote MyFirstCLASSNotebook.ipynb
```

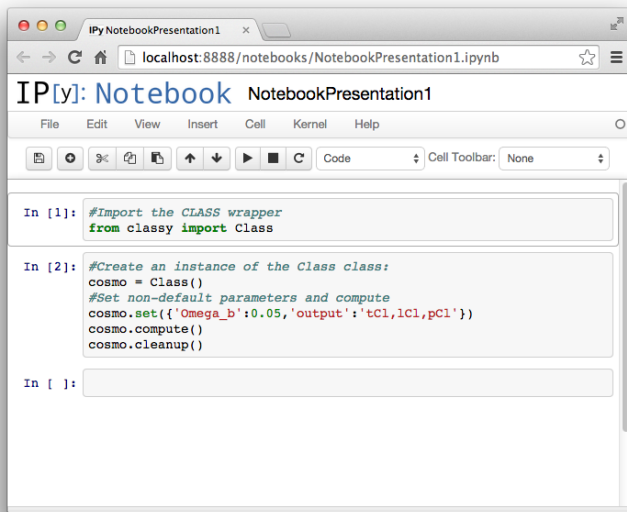

Aliasing

To make an alias, open your shell {`bash`, `zsh`, ...} startup script: {`~\.bashrc`, `~\.zshrc`, ...}

At the bottom of the file, add the line

```
alias inote="some command"
```

The notebook

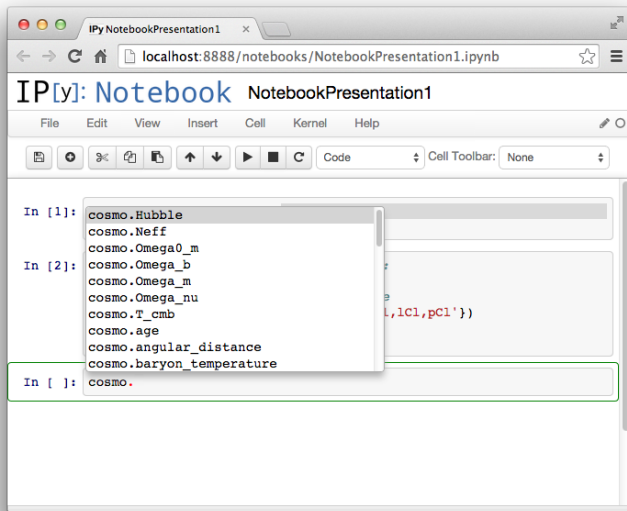

The screenshot shows a web browser window with the title "IP[y]: Notebook NotebookPresentation1". The address bar shows "localhost:8888/notebooks/NotebookPresentation1.ipynb". The notebook interface includes a menu bar (File, Edit, View, Insert, Cell, Kernel, Help) and a toolbar with various icons. The main content area contains three code cells:

```
In [1]: #Import the CLASS wrapper  
from classy import Class
```

```
In [2]: #Create an instance of the Class class:  
cosmo = Class()  
#Set non-default parameters and compute  
cosmo.set({'Omega_b':0.05, 'output': 'tC1,lC1,pC1'})  
cosmo.compute()  
cosmo.cleanup()
```

```
In [ ]:
```

Tab: Available class methods

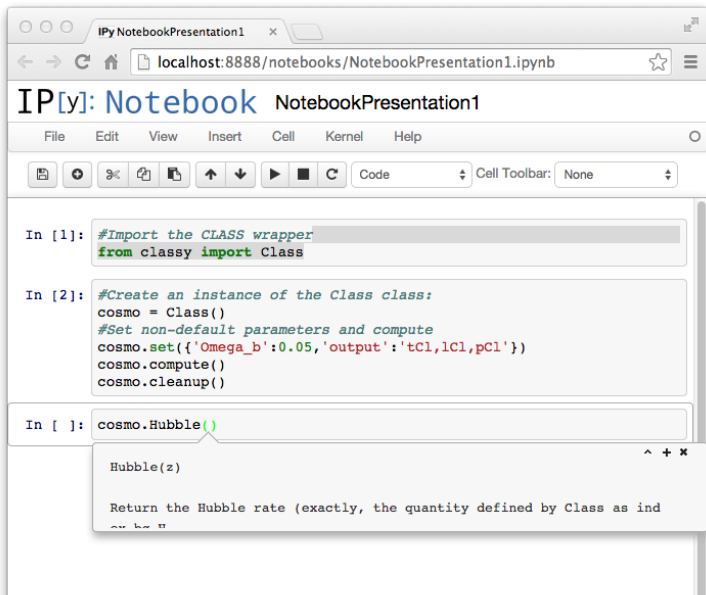

The screenshot shows a web browser window with the URL `localhost:8888/notebooks/NotebookPresentation1.ipynb`. The page title is `IP[y]: Notebook NotebookPresentation1`. The interface includes a menu bar with `File`, `Edit`, `View`, `Insert`, `Cell`, `Kernel`, and `Help`. Below the menu is a toolbar with various icons and a dropdown menu set to `Code`. The main content area displays three input cells:

- `In [1]:` `cosmo.Hubble`
- `In [2]:` `cosmo.Neff`
`cosmo.Omega0_m`
`cosmo.Omega_b`
`cosmo.Omega_m`
`cosmo.Omega_nu`
`cosmo.T_cmb`
`cosmo.age`
`cosmo.angular_distance`
`cosmo.baryon_temperature`
- `In []:` `cosmo.`

A dropdown menu is open over the `cosmo.` input, listing the following methods:

- `cosmo.Hubble`
- `cosmo.Neff`
- `cosmo.Omega0_m`
- `cosmo.Omega_b`
- `cosmo.Omega_m`
- `cosmo.Omega_nu`
- `cosmo.T_cmb`
- `cosmo.age`
- `cosmo.angular_distance`
- `cosmo.baryon_temperature`

Shift+Tab: Help on method

The screenshot shows a web browser window with the URL `localhost:8888/notebooks/NotebookPresentation1.ipynb`. The page title is "IP[y]: Notebook NotebookPresentation1". The interface includes a menu bar (File, Edit, View, Insert, Cell, Kernel, Help) and a toolbar with icons for saving, running, and other actions. The main area contains three code cells:

```
In [1]: #Import the CLASS wrapper  
from classy import Class
```

```
In [2]: #Create an instance of the Class class:  
cosmo = Class()  
#Set non-default parameters and compute  
cosmo.set({'Omega_b':0.05,'output':'tCl,lCl,pCl'})  
cosmo.compute()  
cosmo.cleanup()
```

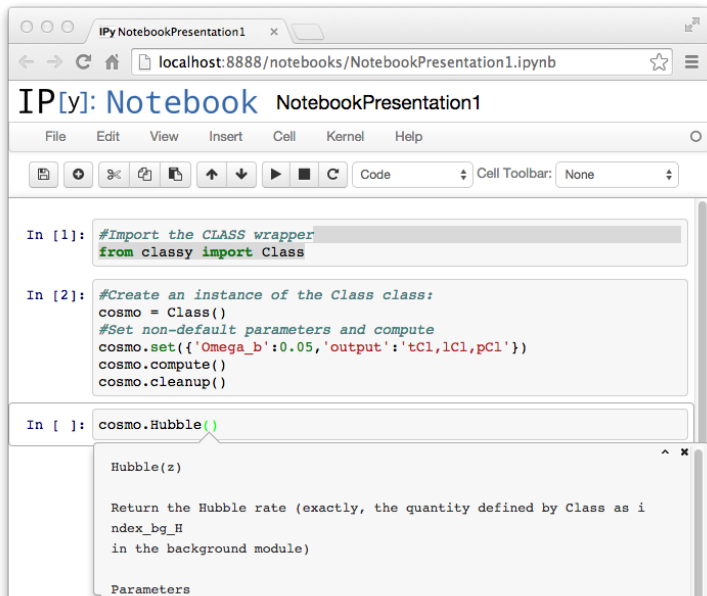

```
In [ ]: cosmo.Hubble()
```

A tooltip is displayed over the `Hubble()` call in the third cell. The tooltip contains the following text:

```
Hubble(z)
```

Return the Hubble rate (exactly, the quantity defined by Class as ind

Shift+Tab: More help

The screenshot shows a web browser window with the URL `localhost:8888/notebooks/NotebookPresentation1.ipynb`. The page title is `IP[y]: Notebook NotebookPresentation1`. The interface includes a menu bar (File, Edit, View, Insert, Cell, Kernel, Help) and a toolbar with icons for saving, running, and other actions. The code editor contains three input cells:

```
In [1]: #Import the CLASS wrapper
        from classy import Class
```

```
In [2]: #Create an instance of the Class class:
        cosmo = Class()
        #Set non-default parameters and compute
        cosmo.set({'Omega_b':0.05,'output':'tCl,lCl,pCl'})
        cosmo.compute()
        cosmo.cleanup()
```

```
In [ ]: cosmo.Hubble()
```

A tooltip is displayed below the `cosmo.Hubble()` call, providing documentation for the `Hubble(z)` method:

```
Hubble(z)

Return the Hubble rate (exactly, the quantity defined by Class as i
ndex_bg_H
in the background module)

Parameters
```

What is available in the wrapper?

- `get_background()` returns the information normally found in `_background.dat`.
- `get_thermodynamics()` returns the information of `_thermodynamics.dat`.
- `get_primordial()` corresponds to `_primordial_Pk.dat`.
- `get_perturbations()` returns everything found in `_perturbations*.dat`
- `get_transfer(z,format)` returns the density and velocity transfer functions at any* redshift `z`. (Format can be either `'camb'` or `'class'`).

What is available in the wrapper?

- `raw_cl()` returns unlensed C_ℓ .
- `lensed_cl()` returns lensed C_ℓ .
- `density_cl()` returns density C_ℓ .
- `pk(k, z)` returns the $P(k)$ at redshift z .
- Many other small functions.

IPython Notebook exercise

Try to solve some or all of exercise 1a-1d from yesterday using the IPython Notebook.

Example notebooks

Play around with some of the example notebooks found in IPythonNotebooks folder on Dropbox.
